

## SUPPLEMENTARY FILE

### HBR Security Framework Proposal

Suppl\_Figure 1 displays the steps for visualizing a sequence for a secure framework regarding a doctor's (MD) navigation in the Hellenic Biomedical Registry (HBR).

*Suppl\_Figure 1. HBR framework proposal for secure MD's navigation .*

**Step 1:** Medical doctors (MDs) of all Hellenic Health Units are able to register in HBR. Therefore, each MD submits the MD Registration Form (as Suppl\_Figure 2 shows) via HBR platform online. He/She receives confirmation and credentials via two-factor authentication (2FA) from the Ministry of Health (governmental agency – administrator of HBR) <sup>1,2</sup>. This initial step ensures that the MD is informed about the security and management of sensitive patient's biomedical data and about the permission to use the software only for biomedical research purposes. Therefore, the MD Registration Form contains consent fields informing the MD for the HBR privacy policy and GDPR regulation awareness (as Suppl\_Figure 2 shows).

**Step 2, 3, 4:** HBR administrators keep secure and update the HBR Active Directory regarding to the MDs' accounts. The MD (HBR end-user) navigates in the HBR using a secure Internet connection with Single Sign On (SSO) methodology over a security provide. Prior HBR real implementation, penetration testing procedures by governmental authorities are necessary to be executed.

**Step 5, 6:** Splitting off the application and database servers of the HBR, it improves the reliability of the system. At this point, the Virtualization Technology (a) increases the availability of the system, (b) ensures easier backup and disaster recovery, and (c) provides an easier route for administrators to install and maintain software, resulting to more efficient IT services. [3]-[5]

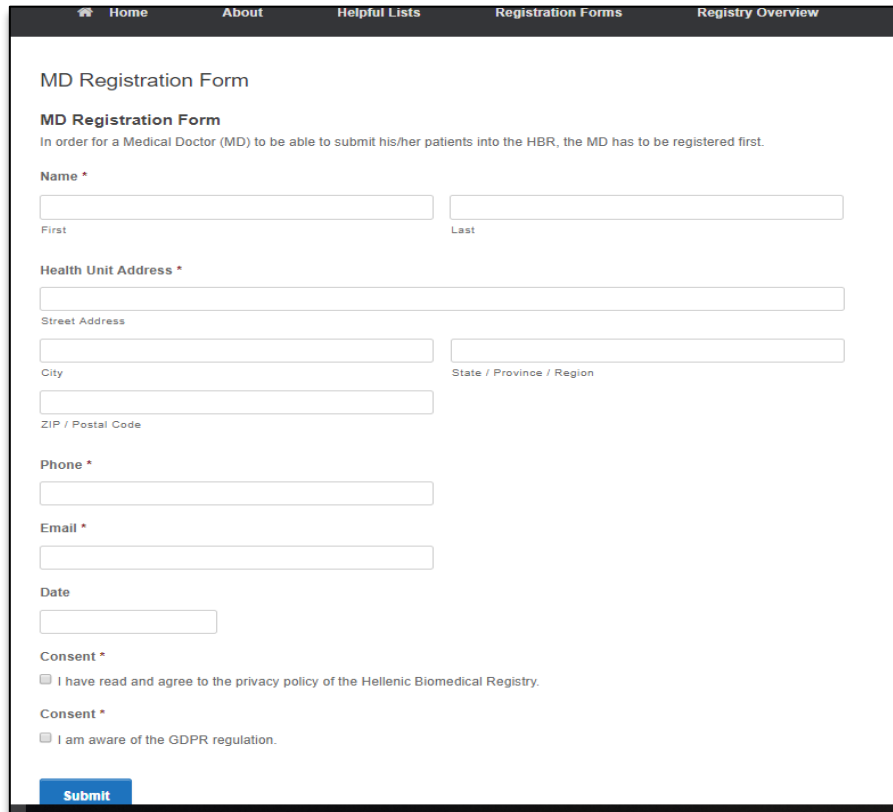

**Input Data:** The MD submits a Case Report Form (CRF), followed with a physically signed patient's application declaring his/her consent to participate in a clinical trial. This step ensures as far as possible the legitimacy of the patient's participation in a data recording system. Moreover, the following points must be mentioned:

- The MD adds/removes/alters patient's clinical and molecular information in the database.
- Only HBR governmental administrators have grants to delete the biomedical data of a patient (following GDPR regulation).
- The need for accurate patients' biomedical information resulting to the doctors' obligation to maintain all their registered patients' data updated. Based on this requirement, additional administrative support to each registered doctor might be necessary.

**Output Data:** All registered MDs are able to survey and query the database for scientific purposes.

## MD Registration Form

Suppl\_Figure 2 shows a screenshot from the HBR MD Registration Form webpage. The consent fields require opt-in action by the MD and are displayed before the submit button.

The screenshot displays the MD Registration Form on a webpage. The navigation bar at the top includes links for Home, About, Helpful Lists, Registration Forms, and Registry Overview. The form title is "MD Registration Form". Below the title, there is a sub-heading "MD Registration Form" and a note: "In order for a Medical Doctor (MD) to be able to submit his/her patients into the HBR, the MD has to be registered first." The form contains several required fields, indicated by an asterisk (\*):

- Name \***: Two input fields for "First" and "Last" names.
- Health Unit Address \***: A single input field for "Street Address".
- City**: An input field for the city name.
- State / Province / Region**: An input field for the state or province.
- ZIP / Postal Code**: An input field for the postal code.
- Phone \***: An input field for the phone number.
- Email \***: An input field for the email address.
- Date**: An input field for the registration date.

At the bottom of the form, there are two consent checkboxes:

- Consent \***:  I have read and agree to the privacy policy of the Hellenic Biomedical Registry.
- Consent \***:  I am aware of the GDPR regulation.

A blue "Submit" button is located at the bottom left of the form.

## HBR General Information Security Policy & Measures

Regarding to our software development and virtual implementation, the general security policies are summarized as follows:

1. HBR modules is developed using WordPress® (free open-source CMS) and Microsoft® Visual Studio 2017 Community (free online/offline MS IDE distribution).
2. HBR security is based on *The Ultimate WordPress Security Guide – Step by Step (2019)* <sup>6</sup> :
  - a. HBR requires credentials to login.
  - b. MySQL Database is accessed only with administration grants.
  - c. WordPress® modules and plugins are daily checked for updates.
  - d. HBR contains plugins as a minimum-security policy:
    - i. Ultimate Member
    - ii. Sucuri Security for Auditing, Malware Scanner and Security Hardening
    - iii. GDPR compliance plugin
    - iv. Google Authenticator – Two Factor Authentication
3. Hospital Datasets were anonymized before we use them into our MySQL database schema.
